

ABSTRACT OF THE DISCLOSURE

A method and a kiosk for managing access to goods and services available via a computer network. A list of
5 identifiers is created. Each identifier is associated with at least one service of a merchant. Tickets are distributed to customers. Access to a service is authorized upon recognition of an identifier on a ticket. The kiosk comprises a generator for generating a list of
10 identifiers, a supervisor which associates an identifier with at least one service of a merchant, a data base of tickets to which the identifier has been applied, and a controller for checking the identifier.
